Enquire Now

In this post i want to share with you how to create Repository Pattern in Laravel 5 application. generally we are getting data directly from model, I mean we are use just MVC. But if you have big application then it is better way if you use Repository Pattern. I will give you few step to create Repository Pattern. normally we use directly from Model but if you make Repository Pattern for every module then it is good way to develop laravel application.

Step 1: Create Interface

In first step we have to create Interface, before create Repositories(**app/Repositories**) directory in app folder. Also we need to create User(**app/Repositories/User**) folder inside Repositories folder.

Ok, now first we will create UserInterface in User directory, so first create UserInterface.php file and put bellow code in that file:

app/Repositories/User/UserInterface.php

```
namespace App\Repositories\User;

interface UserInterface {

    public function getAll();

    public function find($id);

    public function delete($id);

}
```

Step 2: Create Repository

Ok, in this step we will create UserRepository.php for write database login, in this file we will write our database login code. so, first create UserRepository.php file in User directory and put bellow code.

app/Repositories/User/UserRepository.php

```
namespace App\Repositories\User;

use App\Repositories\User\UserInterface as UserInterface;
use App\User;

class UserRepository implements UserInterface
{
    public $user;

    function __construct(User $user) {
        $this->user = $user;
    }

    public function getAll()
    {
        return $this->user->getAll();
    }

    public function find($id)
    {
        return $this->user->findUser($id);
    }

    public function delete($id)
    {
        return $this->user->deleteUser($id);
    }
}
```

Step 3: Create Service Provider

In this step we have to create Service Provider for bind UserInterface and UserRepository class. so let's create UserRepoServiceProvide.php file in User folder and put following code:

app/Repositories/User/UserRepoServiceProvide.php

```

namespace App\Repositories\User;

use Illuminate\Support\ServiceProvider;

class UserRepoServiceProvide extends ServiceProvider
{
    /**
     * Bootstrap the application services.
     *
     * @return void
     */
    public function boot()
    {
    }

    /**
     * Register the application services.
     *
     * @return void
     */
    public function register()
    {
        $this->app->bind('App\Repositories\User\UserInterface', 'App\Repositories\User\UserRepository');
    }
}

```

[See Details](#)

Now, we have to add service provider in app.php file, so add UserRepoServiceProvide in **config/app.php** and add below line.

config/app.php

```

return [
    ....
    'providers' => [
        ....,
        App\Repositories\User\UserRepoServiceProvide::class,
    ]
    ....
]

```

Step 4: Create User Model

We have already User Model i think, so you have just need to add getAll(), findUser() and deleteUser() function. But you can also past below code too. So, let's put below code on your model.

app/User.php

```
namespace App;

use Illuminate\Foundation\Auth\User as Authenticatable;

class User extends Authenticatable
{
    protected $fillable = [
        'name', 'email', 'password',
    ];

    protected $hidden = [
        'password', 'remember_token',
    ];

    public function getAll()
    {
        return static::all();
    }

    public function findUser($id)
    {
        return static::find($id);
    }

    public function deleteUser($id)
    {
        return static::find($id)->delete();
    }
}
```

Step 5: Use In Controller

Now we are ready to use Our Repository Pattern in our Controller. So, let's add bellow code in your UserController.php file.

app/Http/Controllers/UserController.php

```

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Repositories\User\UserInterface as UserInterface;

class UserController extends Controller
{
    public function __construct(UserInterface $user)
    {
        $this->user = $user;
    }

    /**
     * Display a listing of the resource.
     *
     * @return \Illuminate\Http\Response
     */
    public function index()
    {
        $users = $this->user->getAll();
        return view('users.index', ['users']);
    }

    /**
     * Display a listing of the resource.
     *
     * @return \Illuminate\Http\Response
     */
    public function show($id)
    {
        $user = $this->user->find($id);
        return view('users.show', ['user']);
    }

    /**
     * Display a listing of the resource.
     *
     * @return \Illuminate\Http\Response
     */
    public function delete($id)
    {
        $this->user->delete($id);
        return redirect()->route('users');
    }
}

```

Now at last just fire bellow command because we have to auto load class.

```

composer update
php artisan optimize

```
